COHORT 16 DSML- MINI PROJECT DOCUMENTATION

Renewable Energy Transition Speed

Date:03/03/2026

DAY 6: MODEL ACCURACY AND PERFORMANCE

Work Done:

Part A: SDG-7 Impact Analysis

- Interpreted Linear Regression coefficients to understand drivers of renewable energy transition.
- Identified influence of:
    - Solar PV price trends
    - Economic indicators
    - Energy consumption patterns
- Connected model findings to SDG-7 objectives.
- Highlighted how cost reductions in solar technology support faster renewable adoption.
- Insight: Lower solar PV prices and supportive economic conditions positively influence renewable energy transition speed.

Part B: Documentation Finalization

Data Engineering Team:

- Completed Data Section
- Verified final dataset integrity
- Finalized Data Dictionary
- Confirmed GitHub dataset upload

Model Team:

- Documented model workflow
- Recorded evaluation metrics

- Prepared model interpretation
- Created model comparison notes

Part C: Final Review
All Team Members:

- Reviewed GitHub commits
- Prepared project presentation
- Cross-checked report consistency
- Conducted final peer review

Outcome:

A complete Linear Regression–based framework was developed to predict Renewable Energy Transition Speed aligned with SDG-7.

Group Discussion : Day 6
